

1. Write a custom iterator that prints numbers from 1 to N.
2. Create an iterator that returns only even numbers from a given list.
3. Implement an iterator that iterates over a string character by character in reverse order.
4. Write an iterator that yields elements of a list with their index (don't use enumerate).
5. Write a generator that yields digits from an integer one by one.
6. Create a generator that yields cumulative sum of numbers in a list. Example:
[1,2,3] → 1, 3, 6
7. Implement a generator that yields vowels from a string.
8. Create an iterator that yields words from a sentence one by one.
9. Write an iterator that returns characters at even indices of a string.
10. Implement a generator that yields running maximum from a list Example:
[3,1,4,2] → 3, 3, 4, 4
